

$N_c(I) = 6$ **cold** nodes

$N_w(I) = 4$ **warm** nodes

One cluster, one image I : every eligible node is either **cold** or **warm** for that image.

Warm $\rightarrow$ job starts immediately. **Cold** $\rightarrow$ job waits for the pull-time $p(I)$ before useful work.

Identity: $N_w(I) + N_c(I) = N$ (here $4 + 6 = 10$).
