

Burst: 3 jobs land on cold nodes

J_1, J_2, J_3 are **affected jobs** (scheduled onto cold nodes). J_1 and J_2 share node N_0 .

Result: only 2 nodes newly warmed

N_0 and N_2 become **newly warm**. N_0 served two jobs but warms only once.

Affected jobs = 3 $\neq$ Newly warmed nodes = 2. Many jobs can wait on one cold node; the node warms only once.
